NETWORK INFRASTRUCTURE MANAGEMENT

Network infrastructure is a key component of any organization. Properly built, it provides connectivity to all the equipment needed for the smooth running of all business processes and IT services in the organization. In order to build a well-functioning and secure network infrastructure, it must first be properly designed. Cluster ITOS takes into account the current and future needs of our customers as well as the trends and developments of technology.

The systems we build are:

- Flexible, according to the specific needs of each organization;
- Secure and reliable;
- Reserved to ensure business continuity;
- Fully tailored, not only to the current needs of the organization but also to future development plans, providing opportunities for easy upgrade;
- The ability to implement server virtualization both during construction and at a future time should also be missed.

Over the years, we have designed, deployed and maintained a variety of network infrastructure solutions, including wireless technologies, voice communications, routing and switching solutions, data transfer solutions between disk arrays and information security systems. We use technologies such as VPN and MPLS for network, infrastructure and communications solutions for voice and data exchange that we offer to organizations with remote offices and structural units.

We build state-of-the-art technologies by proven global leaders such as: Cisco, Aruba, HP, Avaya, Juniper, Motorola, Microsoft, Check Point, D-Link and TP-Link. We offer maintenance and service meeting world standards, forming a complete solution.

Our solutions ensure a secure network that meets your current and future needs.
